

Dear Hiring Manager,

I am a software and platform engineer with over seven years of professional experience designing, building, deploying, and maintaining production systems across cloud infrastructure, backend services, internal platforms, automation workflows, and full-stack applications. My background combines strong software engineering experience with deep infrastructure knowledge, allowing me to build scalable systems that improve reliability, reduce manual effort, and create measurable operational impact.

In my current role supporting Apple TV, I have owned the full lifecycle of multiple internal platforms and automation systems used across cross-functional teams. Much of my work has focused on designing and developing production software, including Python and Golang services, APIs, Kubernetes-hosted applications, full-stack tools, and AWS-based distributed workflows. One of my most impactful projects involved redesigning a manual media processing workflow into a fully automated AWS pipeline using Lambda, S3, SQS, SNS, and SES, significantly increasing throughput while improving error handling, visibility, and reliability.

I have also built internal applications and dashboards that help technical and non-technical teams better understand complex workflows, investigate issues, and reduce time spent on manual operational tasks. This includes AI-assisted tooling, asset-level monitoring, automated reporting, and custom applications that support large-scale data processing. My work often requires gathering requirements directly from stakeholders, translating ambiguous business needs into technical designs, and delivering systems that remain maintainable after they reach production.

Earlier in my career, I gained broad experience across full-stack development, DevOps automation, and infrastructure engineering. At MyCuru, I worked on a small engineering team building a cloud-native video platform using React, Python, and AWS services such as API Gateway, Lambda, S3, and Route 53. At Trapp Technology, I contributed to production Go and Python codebases, automated Linux workflows, and designed on-premises Kubernetes infrastructure. At Neustar, I improved CI/CD pipelines, Ansible automation, Terraform modules, and Docker-based microservice workflows.

I am interested in opportunities where I can continue building reliable software systems, scalable platforms, and automation that meaningfully improves how teams work. I bring a practical engineering mindset, strong ownership, and experience working across software, infrastructure, cloud services, and AI-assisted tooling. I would welcome the opportunity to discuss how my background could support your team's goals.

I can be reached at (209) 534-1837 or tj@brackett.dev. Professional references are available upon request.

Thank you for your time and consideration.

Sincerely,
TJ Brackett
