

TJ Brackett

Software Engineer | Platform & Automation

Software and platform engineer with 7+ years of experience designing and building scalable automation systems, distributed workflows, internal platforms, and cloud-native applications. Experienced owning the full lifecycle of production systems across architecture, backend development, Kubernetes infrastructure, CI/CD, and operational support. Strong background in Python, Golang, AWS, and AI-assisted tooling with a focus on scalability, reliability, and automation at scale.

WORK EXPERIENCE

DevOps Engineer (Software Engineering Focus)

TEKsystems at Apple TV

09/2023 - 04/2026

Remote

Achievements/Tasks

- Designed, developed, deployed, and maintained 8 internal production systems and automation platforms used across 10+ teams, with full ownership spanning design, deployment, monitoring, incident response, and long-term feature development.
- Redesigned and rebuilt a large-scale AWS media processing workflow using Lambda, SQS, SNS, S3, and SES, increasing throughput from ~5 titles/week to ~20 titles/day while fully automating a previously manual process.
- Engineered automated error recovery, email alerting, and real-time operational visibility for a 9-stage distributed workflow processing large-scale media datasets containing petabytes of assets and files up to 50GB each.
- Architected a centralized Streamlit dashboard with integrated AI chatbot support, enabling technical and non-technical stakeholders to monitor workflow status, investigate asset-level issues, and retrieve operational insights in real time.
- Built scalable Python services, APIs, and full-stack applications deployed on Kubernetes using Docker, React, Flask, and PostgreSQL to support internal tooling and large-scale data processing operations.
- Optimized large-volume checksum generation pipelines by designing distributed Kubernetes workloads with parallelized processing pods coordinated through centralized queue management and automated error handling APIs.
- Led technical coordination for collaborative engineering projects by defining architecture, gathering requirements from stakeholders and vendors, delegating implementation tasks, reviewing deliverables, and managing releases and production support.
- Partnered directly with operators, media teams, accounting, vendors, project managers, and engineering leadership to identify bottlenecks, automate manual workflows, and deliver scalable business-critical tooling.

SKILLS

Python

AWS

Kubernetes

Docker

React

PostgreSQL

FastAPI

Typescript

Terraform

CI/CD

Jenkins

LLM Integration

Agentic Workflow

Ansible

Linux

RAG

LangChain

S3

SNS

Lambda

Git

SES

Golang

MySQL

EC2

SQS

DynamoDB

Node.js

MCP

Bash

ChromaDB

Large-scale datasets

Full-Stack Dev

PERSONAL PROJECTS

Indie Game Development

- Building a complex tabletop game using Pygame for rapid prototyping and iteration and Unity/C# for the polished client, backed by scalable Golang microservices handling multiplayer and game logic.

Home Network Command Center

- Raspberry Pi-based network monitor with a Discord bot interface for real-time traffic inspection, per-device blocking, and anomaly alerting. All controls are accessible through simple bot commands without touching config files.

AI Sheet Music Grader

- Using AI vision to analyze sheet music and score it against a custom grading framework designed to unify existing systems such as Suzuki into a common schema, addressing the lack of any universal standard across the industry.

Custom AI Automation Toolkit

- Multi-agent orchestration system using LangGraph, FastAPI, ChromaDB, MCP servers, and LangSmith. Conducts an in-depth spec interview before autonomous code generation to eliminate assumptions and produce production-ready codebases.

WORK EXPERIENCE (cont.)

DevOps Engineer

Neustar, Inc.

09/2022 - 03/2023

Remote

Neustar, Inc offers real-time analytics, fraud validation, and marketing information for the top telecommunication companies in the country.

Achievements/Tasks

- Developed and optimized CI/CD workflows through reusable Jenkins pipelines, improving deployment consistency and reducing manual operational overhead.
- Enhanced and expanded Ansible automation frameworks to improve infrastructure scalability, configuration flexibility, and deployment efficiency across environments.
- Designed reusable Terraform modules and infrastructure templates to standardize cloud resource provisioning and improve maintainability.
- Deployed and supported Docker-based microservice workflows while collaborating with engineering teams to streamline development and release processes.

DevOps Technician

Trapp Technology

09/2020 - 09/2022

Remote

Trapp Technology provides Managed Services, Cloud Hosting, and IT Security Services.

Achievements/Tasks

- Designed and implemented on-premises Kubernetes infrastructure using Kubeadm, Calico, and MetalLB to support containerized workloads within the company's private cloud environment.
- Automated Linux server provisioning and operational workflows through Ansible playbooks and Bash scripting, reducing manual configuration effort and improving deployment consistency.
- Contributed to production Go and Python codebases supporting internal infrastructure tooling and operational services.
- Built CI/CD pipelines using Jenkins and GitHub Actions to automate deployments and streamline development workflows.
- Supported cloud hosting and managed infrastructure environments while troubleshooting production issues and improving operational reliability.

Full Stack Developer

MyCuru (Startup)

11/2019 - 09/2020

Achievements/Tasks

- Developed and maintained a cloud-native video platform using React, Python, and AWS services including API Gateway, Lambda, S3, and Route 53 within a small 2-person engineering team.
- Designed and implemented backend APIs and serverless workflows in Python to support video uploads, processing, storage, and content delivery functionality.
- Built and maintained AWS infrastructure supporting scalable frontend hosting, API routing, file storage, and application deployment workflows.
- Collaborated directly with the CEO and CTO on product planning, architecture decisions, feature development, and rapid iteration in a startup environment.
- Automated rollouts to development and production environments through GitHub Actions.

EDUCATION

Bachelor of Science in Computer Science

California State University, Stanislaus
